

Is Poor Quality Water Affecting Your Turf?

Carbonate deposits can build up in soil as a result of poor irrigation water quality, causing sealing of soils and reducing the effectiveness of irrigation, fertilization, and chemical programs.

Blast® is an advanced sprayable and injectable acid, combining the performance of a strong mineral acid with ease of handling and greater safety. It safely dissolves carbonate build-up in the soil, rapidly opens soil pores for better infiltration and percolation of water, and frees up calcium, magnesium and other bound nutrients. Blast gives you a healthier growing environment and better turf.

Features & Benefits

- Can be sprayed or injected to match your program
- Frees up calcium, magnesium, and other essential nutrients in the soil
- Opens soil pores for better water movement

USE RATES:

- **Spraying:** Apply Blast at 32-64 oz. per acre with a spray volume of 50 gallons of water per acre for fairways and 88 gallons of water per acre for greens. Apply once a week for three weeks to get initial effect, and then apply every two weeks as needed through the growing season. After spray application, immediately irrigate the area lightly to wash Blast off the canopy and into the soil profile.
- **Injection:** Inject Blast at ½ to 1 gallon/ acre monthly through the growing season or as needed.

See label for complete usage information.

 **ENHANCEMENT**

Please check with your Aquatrols distributor for available pack sizes.

Irrigated with Pure Water

Irrigated with 100 ppm Bicarbonate
